

Plate Laid Dandy Rolls

The construction pattern of this Dandy roll is totally different from that of a Plain wove or a Chain Laid Dandy. The body of the Dandy Roll is made from independently circled hollow type rings from 0.3 to 0,5 mm thick sheets as per the diameter of the Roll with end casting as per paper mills design. At a distance of approximately 0.3 mm from the periphery of the rings mini diameter holes from 0.45 to 0.7 mm are drilled and laid wires of 0.35 to 0.6 mm are passed through each and every ring and then soldered in position. The body rings are then evenly filed and polished to achieve uniform height. These Dandy rolls also are exclusively used for manufacture of Ledger or laid papers.
